

INDIVIDUAL CONTRIBUTION

CHOH JING YI

As a dedicated and active member of our project group, I have been deeply involved in every phase of the project. I consistently participated in group meetings, maintaining open communication with my team members, and making sure that I follow the guidance provided by our group leader. I believe that effective communication is crucial to the success of any project, and I always strive to contribute valuable ideas and suggestions to improve the overall quality and functionality of the system. I have played a crucial role in the documentation process, working closely with my team to ensure that all necessary documentation was created and kept up to date. I contributed to documenting key project documentation such as the project proposal SRS, SDD, STD, and P1 and P2. The documentation provides comprehensive explanations of the key features of my module (financial report generation module).

I contributed to the financial report module in this system, which allows members to generate detailed financial reports based on various criteria. Members can choose to view reports for a specific monthly, yearly, or custom date range. Additionally, they can filter the reports by transaction type, such as deposit or withdrawal, and loan type to focus on relevant data. The financial report includes several sections, such as member share details, loan information, transaction history, and loan details, giving members a comprehensive overview of their finances. For added convenience, members can also download the financial report as a PDF version making it easier for them to store and access the reports for future reference or record-keeping.

In a nutshell, my individual contribution in this project is completing all the task relations with financial report generation with all the documentations and design diagram tasks. This module is a core feature of the KADA system, and I am proud to have contributed to its successful implementation and integration into the overall system.

LIM YU HAN

As a team member, I was responsible for the development and documentation of the Saving Account Management and Customer Service modules. My role involved designing the system structure, implementing core functionalities, integrating with other modules, and ensuring a smooth user experience. These modules play a crucial role in the financial management of cooperative members, allowing them to manage their savings efficiently while also providing a direct communication channel with the administrative team. Additionally, I contributed to system documentation by preparing system diagrams like sequence diagram, entity relationship diagram for Saving Account Management module and the data dictionary. These contributions played a critical role in ensuring a well-structured and maintainable database, aiding future system enhancements and debugging processes.

For the Saving Account Management module, members can use the system to perform deposit and fund transfer transactions. To enhance usability, I added membership fees table and a transaction history section, where members can track their previous transactions with details. I also incorporated a filtering function, enabling users to view specific types of transactions easily. Additionally, I implemented a receipt download feature to allow members to obtain proof of transactions. To maintain data accuracy and integrity, I implemented input validation checks, preventing issues such as negative balances or invalid transaction amounts. I also conducted unit testing to verify the accuracy of deposits, transfers, and balance calculations. To improve user experience, I developed the function Customer Service, which enables members to submit inquiries regarding their accounts and receive responses from administrators. This module ensures structured and efficient communication between members and the admin, providing a direct support system for resolving financial concerns.

Furthermore, I actively participated in group discussions and collaborated with team members where we analysed technical challenges and optimized workflows so that improvements can be done in order to achieve better results in the system. I was involved in system testing and debugging, ensuring that all database transactions functioned correctly without data inconsistencies. My contributions to both documentation and system implementation have strengthened the overall efficiency, usability, and maintainability of our project.

JOANNE CHING YIN XUAN

I was a member of the team working on the KADA cooperative system project, where I was responsible for developing the Admin Module, which manages applications, member records, email notifications, and administrative reports. I concentrated on refining the application approval process, allowing admins to easily review and manage applications for membership, loans, terminations, and fees transactions. I designed a system that allows admins to see complete details about an application before they decide to approve it or not. When applications were rejected, I added a feature where admins had to include a clear reason so as to not leave the user in the dark.

These areas helped me gain a good sense of what needs to be improved in terms of communication and minimize the hassle of every member logging into the application to check their status by also developing an automated email notification service. It provides an extra level of user engagement and convenience, ensuring that members see updates on their application decisions direct to their inbox. I also developed the member management system where admins can view all the active and inactive members. This is aimed at finding members who are but this is about me suggesting a retirement to that member so that the admin can send him a retirement notification email. This also provides a means for member transitions to be managed both internally and in a manner that adheres to the cooperative system.

As part of that role, I designed and implemented the administrative reporting system, providing descriptive statistics on a variety of features of the KADA cooperative. And there is extensive reporting functionality for graphical analysis of loan applications, transaction activities, membership applications and membership terminations. Such visual reports help admins to know about trends and take informed decisions. All reports were made downloadable for end users to refer and document.

I also engaged in group discussions and worked well with my team members to test technical problems and develop workflows for continuous improvement in the Admin Module. Specifically, I was involved in testing and troubleshooting the application submit process, App notifications, and admin reports, ensuring that all systems worked properly without error or disaster. In addition to system documentation and system implementation, I contributed to enhance the overall efficiency, accuracy, usability of the KADA cooperative system.

As a result of the contributions I made, the administrative workflow of the KADA cooperative system became really efficient and effective. I contributed by creating an application approval, member management streamlined, an email notifying system, and advanced reports data visualization that would generate more structured, user-friendly, and data driven system for administrators.

LEE YIN SHEN

During the development of the KADA Cooperative System, I was responsible for implementing the Membership Module, ensuring that members can apply for and manage their membership status. I developed some modules, one of them was developing the Membership Application Module, where I designed the member profile system. When new users enter the system for the first time, they are prompted to complete their profiles and submit a membership registration form, which allows them to become official members. To enhance user experience, I created a dashboard where members can track their application status and download receipt for their application.

Additionally, I developed the Membership Termination Module, allowing members to submit a form to quit the system through an option in their profile sidebar. Members who want to reapply membership after termination are informed of the associated penalty fees for a second-time membership application. This process ensures that members are fully aware of their options while maintaining the cooperative's policies effectively.

Besides my technical contributions, I also played a crucial role as the Project Manager. I actively tracked the progress of my teammates, tested their work, and provided feedback for improvements. I ensured that different modules worked seamlessly together. I also actively involved myself in meetings and discussions. By maintaining constant communication with my team, I helped improve efficiency and guided the project towards successful completion.

Last but not least, I took the responsibility of hosting the KADA Cooperative System. This process required additional modifications to the system to ensure compatibility with the hosting tool, which took time and effort. By resolving hosting challenges and optimizing the deployment, I ensured that the system was stable, accessible, and fully functional for end users.

Through my contributions, I played a significant role in enhancing the efficiency, usability, and overall success of the KADA Cooperative System. My work on the Membership Module streamlined the membership application and termination processes, while my leadership ensured seamless collaboration among team members. Hosting the system was a crucial final step that allowed the cooperative to effectively implement and utilize the platform.

ELIJAH SHE YU SHENG

Developing the KADA Cooperative System was a transformative experience that allowed me to apply my technical skills while also honing my leadership abilities. My primary responsibility was implementing the login and logout sessions, ensuring a secure authentication process for users.

I developed features that validated user credentials, provided error messages for incorrect inputs, and logged unsuccessful login attempts for security purposes. Furthermore, I incorporated a password recovery option to enhance user accessibility and security. These measures improved system integrity and provided users with a seamless experience when accessing the platform.

I also played a significant role in the loan application process, ensuring that users could apply for loans effortlessly. This involved validating user inputs, including loan type, amount, and period, while implementing error messages for invalid inputs such as exceeding loan amount limits or missing documents. These measures ensured compliance with cooperative policies while improving user experience.

Beyond my technical contributions, I took on the role of Vice Project Manager, overseeing the team's progress and ensuring that all modules functioned cohesively. I actively tested my teammates' work, provided constructive feedback, and facilitated discussions to resolve challenges. By maintaining continuous communication, I helped optimize our workflow, making sure that the project met its objectives efficiently and effectively.

Through my contributions, I significantly enhanced the efficiency and usability of the KADA Cooperative System. Implementing secure login and logout sessions strengthened system integrity, and my work on the loan application process improved accessibility. Hosting the system was an essential step in ensuring its long-term success and accessibility. This experience reinforced my technical expertise, problem-solving skills, and ability to manage a team towards a common goal, all of which will be invaluable in my future endeavors.
